

Power BI Assignment 2

1) Explain the advantages of Natural Queries in power BI with an example?

Ans → Natural Language Query is the ability to use natural language expressions to discover and understand data and accelerates the process of finding answers the data can provide.

Another way to think about it would be a translation mechanism that helps bridge the gap between technical and non technical users who ^{may} cannot understand which database has the data, which field to use or how to create calculations to answer their customer.

Example: "How many customers made a purchase this month?"

2) Explain web front End (WFE) cluster from Power BI Service Architecture?

Ans → Power BI architecture

The Power BI service is built on Azure, Microsoft Cloud Computing program. Power BI is currently deployed in many data centers around the world - there are many active deployments made available to customers in the regions served by those data centers.
